Box No. IV Text of the abstract (Continuation of Item 5 of the first sheet)

Device and method for free flow electrophoresis having a microchip (1) comprising: a separation chamber (5); a plurality of separation medium inlet channels (9), a sample inlet channel (7) having an outlet fluidly connected to the inlet side of the separation chamber through which a flow of a sample containing charged components is in use introduced into the separation chamber; a plurality of outlet channels (17) having inlets fluidly connected to another, outlet side of the separation chamber opposite the inlet side thereof-, and a magnetic field unit (31) for providing a magnetic field substantially orthogonal to the flow direction of the separation medium; whereby charged components introduced into the separation chamber are deflected laterally across the separation. chamber in dependence upon the charge, typically the electrophoretic mobilities or the iso-electric points, of the charged components.
